

# **How did the pandemic affect unemployment in Georgia?**

Group A2: Iyesogie(Stephany) Obakpolor, Nnamdi Emmanuel Obodoechine, Donald Yakam Ngandeu, Tina Huang,Asim Syed

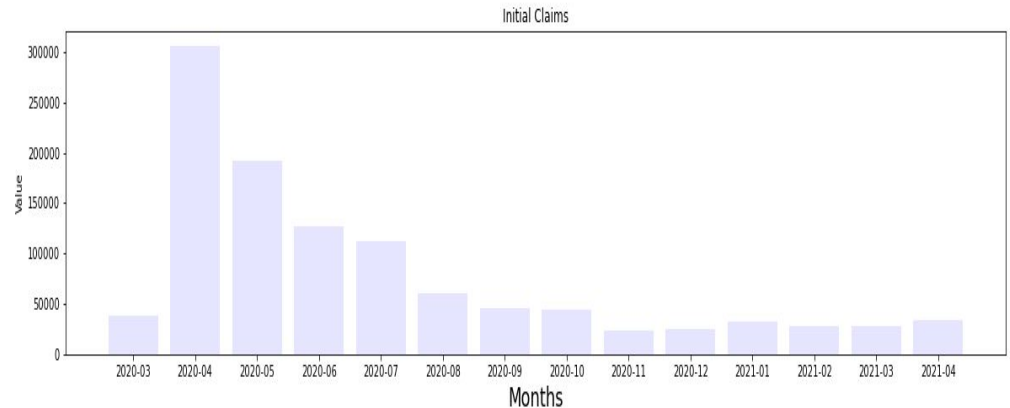

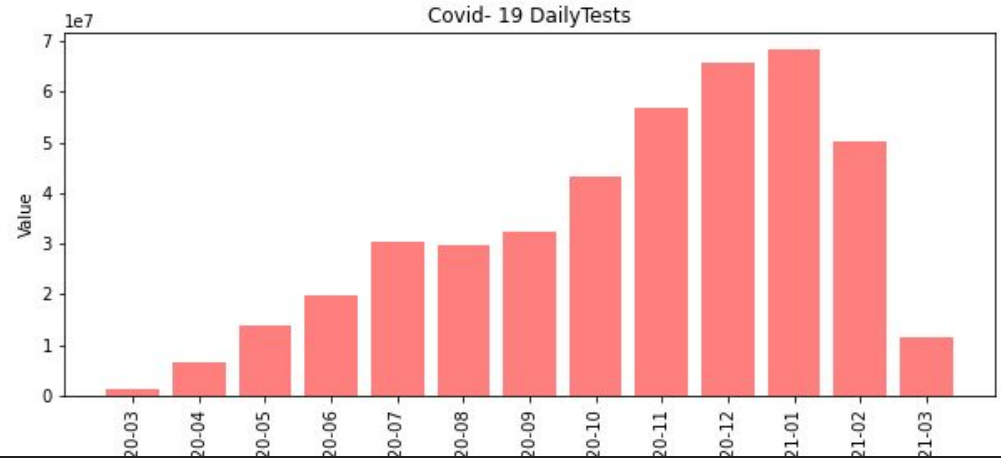

# The Questions - The Remix

- 1) What is the relationship between the number of covid test administered and the number of confirmed cases/deaths?

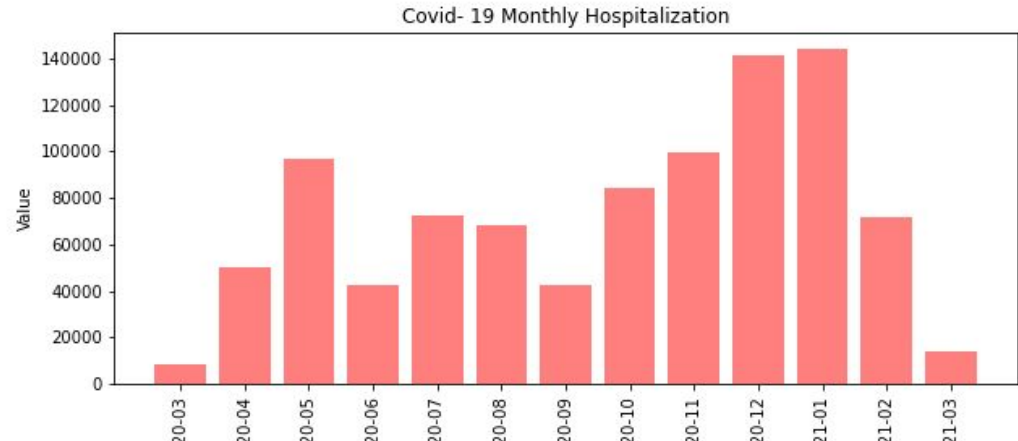

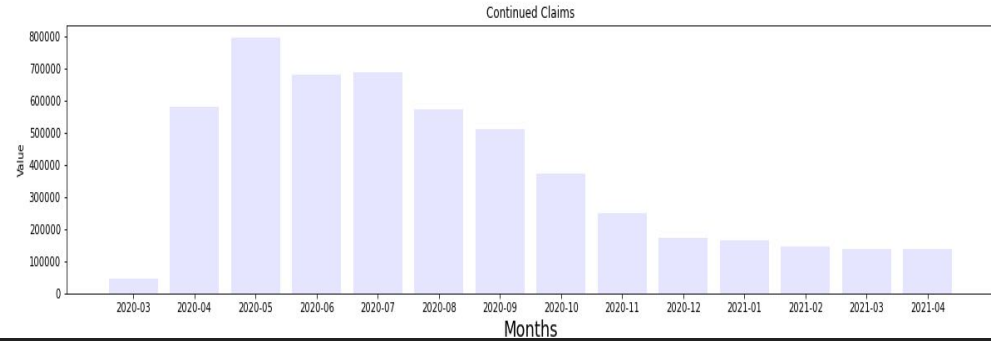

# The Question-The Remix

2) what is the relationship between the initial number of unemployment case and the the number of test?

# The Question-The Remix

3) What is the relationship between the number of hospitalizations and the continued unemployment claims?

# The Question-The Remix

What is the relationship between the  
number of initial unemployment claims,  
the continued claims and the  
unemployment rate

# The Findings

- There were significantly more test administered than confirmed cases and deaths, especially during the last quarter of 2020. Then we see a dramatic drop in the number of test administered in the first quarter of 2021.
- As the pandemic began we saw a large amount on initial unemployment case, however there we had far fewer test administered. Then we see a swap as the number of test increased the number of initial unemployment claims decreased.

# The Findings

- Throughout the pandemic there has been steady number of hospitalizations. However we can see a spike in the months that had a decreased number of continued cases
